CareerOneStop Business Center

XPAND Corporation developed the **U.S. Department of Labor's CareerOneStop.org** website as a cloud based portal for jobs and career information to serve as a comprehensive one-stop online resource for America's workforce.   The portal provides **job seekers** with access to diverse career resources through one seamless browser interface. **CareerOneStop.Org** received more than 20,000,000 site visits with 260,000,000 page views last year in addition to receiving multiple national and state awards for its unique functions.

Recently*, XPAND* developed and launched the CareerOneStop's new **Business Center**, a one-stop portal providing access to workforce information and available state and local resources to help **employers** recruit, hire, and train a strong workforce. Users can search over **three thousands local American Job Centers** and contact local **Business Service Representatives** to receive recruiting support, including how to post resumes on a free online job bank and receive the latest HR updates. In addition, they can get easy access information on **600 different occupations** like state and local average wages for each occupation and training resources.

XPAND Corporation was tasked with the development of this uniquely comprehensive career website, spanning all phases of the **System Development Life Cycle (SDLC)** including planning, analyses of user requirements, designing the databases, testing, deployment, and documentation. *XPAND* successfully integrated a **services-based architecture** utilizing **SOAP/XML** and **REST** based web services to facilitate **data currency, data exchange, and data sharing**.

XPAND implemented **Endeca**, an enterprise-wide search and indexing tool that reaches across all the CareerOneStop assets to provide users a robust search platform to assist them in finding both **static site content** and **database content from various sources**. Search capabilities include **thematic searches**, which rank the keyword search results based on predefined weights assigned to the result sets.   You *can check it out* for yourself at:
